Experiment 26: Linear Regression for Housing Price Prediction

Aim: To predict house prices using Linear Regression.

Algorithm:

1. Import NumPy and Linear Regression.
2. Create house area and price data.
3. Train the regression model.
4. Get house area from the user.
5. Predict and display the price.

Code:

```
import numpy as np
from sklearn.linear_model import LinearRegression

X = np.array([[1000], [1200], [1500], [1800], [2000]])
y = np.array([20, 25, 30, 35, 40])

model = LinearRegression()
model.fit(X, y)

area = float(input("Enter house area: "))
price = model.predict([[area]])

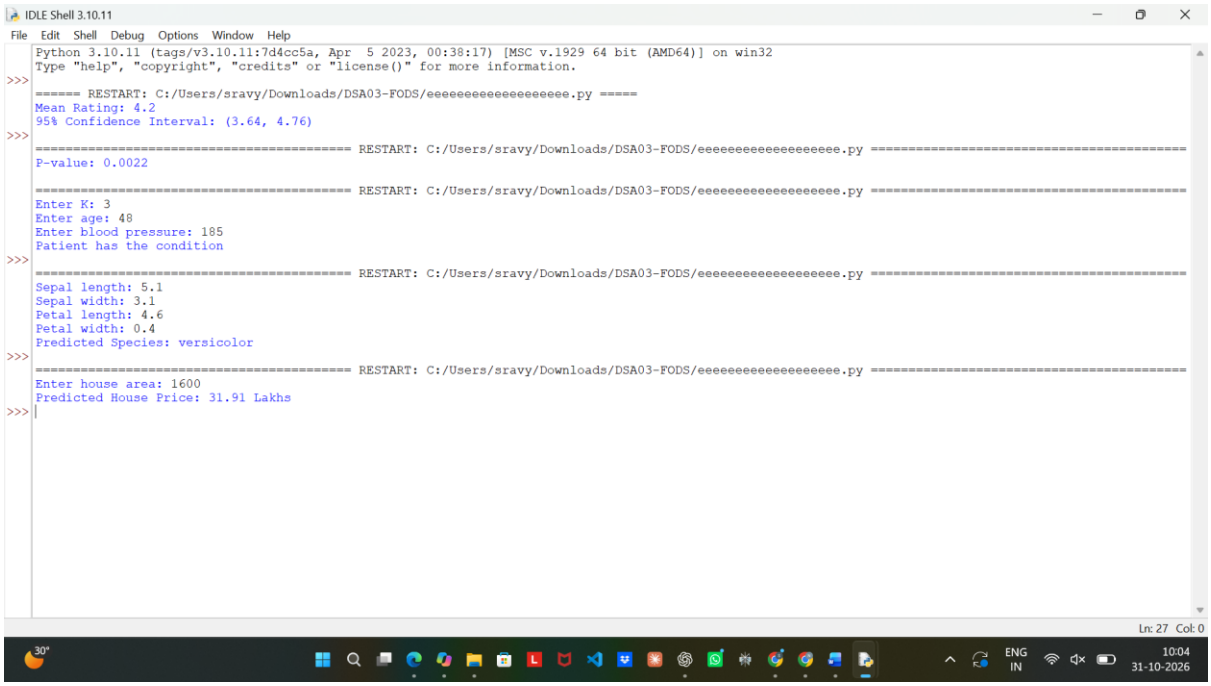

print("Predicted House Price:", round(price[0], 2), "Lakhs")
```

Input:

Enter house area: 1600

Output:

Predicted House Price: 32.0 Lakhs

Result: The house price was successfully predicted using Linear Regression.
