QUESTION 15: FREQUENCY DISTRIBUTION OF POST LIKES

15. Scenario: You are a data analyst working for a social media platform. As part of your analysis, you have a dataset containing user interaction data, including the number of likes received by each post. Your task is to develop a Python program that calculates the frequency distribution of likes among the posts.

Question: Develop a Python program to calculate the frequency distribution of likes among the posts?

Aim: To calculate the frequency distribution of likes received by social media posts using Python.

Algorithm:

1. Import Pandas.
2. Create a DataFrame containing post likes.
3. Use value_counts() to calculate the frequency of each like count.
4. Sort and display the results.

Code:

```
import pandas as pd

data = pd.DataFrame({

   'Likes': [10, 20, 10, 30, 20, 10, 40, 30]

})

frequency = data['Likes'].value_counts().sort_index()

print("Likes Frequency:")

print(frequency)
```

Input:

Likes = [10, 20, 10, 30, 20, 10, 40, 30]

Output:

Likes Frequency:

10 3

20 2

30 2

40 1

```
>>>
========== RESTART: C:/Users/sravy/Downloads/DSA03-FODS/ex13.py ==========
Likes Frequency:
Likes
10    3
20    2
30    2
40    1
Name: count, dtype: int64
>>>
```

Result: The frequency distribution of likes among social media posts was calculated successfully.
